Normalization

Functional Dependency and Schema Refinement

Dr. Ram Kishan Dewangan Assistant Professor, ECED Thapar University, Patiala

How to find key?

- Conditions to find key
 - The attribute is a part of key, if it does not occur on any side of FD
 - The attribute is a part of key, if it occurs on the left-hand side of an FD, but never occurs on the right-hand side
 - The attribute is not a part of key, if it occurs on the right-hand side of an FD, but never
 occurs on the left-hand side
 - The attribute may be a part of key or not, if it occurs on the both side of an FD

How to find key? [Example]

- Let a relation R with attributes ABCD with FDs C \rightarrow A, B \rightarrow C. Find keys for relation R.
 - attribute not occur on any side of FDs (D) v
 - attribute occurs on only left-hand side of an FDs (B) √
 - attribute occurs on only right-hand side of an FDs (A) X
 - attribute occurs on both the sides of an FDs (C)?
- The core is BD.
- B determines C and C determines A, So using transitivity rule B determines A also.
- So BD is a key.

How to find key? [Exercise]

- Let a relation R with attributes ABCD with FDs C → D, C → A and B → C. Find keys for relation R.
 - The core is B. B determines C which determines A and D, so B is a key. Therefore B is the key.
- Let a relation R with attributes ABCD with FDs B \rightarrow C, D \rightarrow A. Find keys for relation R.
 - The core is BD. B determines C and D determines A, so BD is a key. Therefore BD is the key.
- Let a relation R with attributes ABCD with FDs A → B, BC → D and A → C. Find keys for relation R.
 - The core is A. A determines B and C which determine D, so A is a key. Therefore A is the key.

- ▶ Suppose you are given a relation R with four attributes ABCD. For each of the following sets of FDs, do the following: $F = (B \rightarrow C, D \rightarrow A)$
 - Identify the candidate key(s) for R.
 - Identify the best normal form that R satisfies (1NF, 2NF, 3NF or BCNF).

Candidate Key is BD

Relation R is in 1NF but not 2NF. In above FDs, there is a partial dependency

(As per FD B \rightarrow C, C depends only on B but Key is BD so C is partial depends on key (BD))

(As per FD D \rightarrow A, A depends only on D but Key is BD so A is partial depends on key (BD))

- ▶ Suppose you are given a relation R with four attributes ABCD. For each of the following sets of FDs, do the following: $F = (C \rightarrow D, C \rightarrow A, B \rightarrow C)$
 - Identify the candidate key(s) for R.
 - Identify the best normal form that R satisfies (1NF, 2NF, 3NF or BCNF).

Candidate Key is B

Relation R is in 2NF but not 3NF. In above FDs, there is a transitive dependency

(As per FDs B \rightarrow C & C \rightarrow D then B \rightarrow D so D is transitive depends on key (B))

(As per FDs B \rightarrow C & C \rightarrow A then B \rightarrow A so A is transitive depends on key (B))

- ▶ Suppose you are given a relation R with four attributes ABCD. For each of the following sets of FDs, do the following: $F = (A \rightarrow B, BC \rightarrow D, A \rightarrow C)$
 - Identify the candidate key(s) for R.
 - Identify the best normal form that R satisfies (1NF, 2NF, 3NF or BCNF).

Candidate Key is A

Relation R is in 2NF but not 3NF. In above FDs, there is a transitive dependency

(As per FDs A \rightarrow B & A \rightarrow C then A \rightarrow BC using union rule) and

(As per FDs A \rightarrow BC & BC \rightarrow D then A \rightarrow D so D is transitive depends on key (A))

- ▶ Suppose you are given a relation R with four attributes ABCD. For each of the following sets of FDs, do the following: $F = (ABC \rightarrow D, D \rightarrow A)$
 - Identify the candidate key(s) for R.
 - Identify the best normal form that R satisfies (1NF, 2NF, 3NF or BCNF).

Candidate Key are ABC & BCD

Relation R is in 3NF but not BCNF.

In the above FDs, both FDs have prime attribute (D and A) in dependent (right) side.

Functional Dependency (FD) and its types

What is Functional Dependency (FD)?

- Let R be a relation schema having n attributes A1, A2, A3,..., An.
- Let attributes X and Y are two subsets of attributes of relation R.

Student

- If the values of the X component of a tuple uniquely (or functionally)
 determine the values of the Y component, then there is a functional
 dependency from X to Y. This is denoted by X → Y.
- (i.e RollNo \rightarrow Name, SPI, BL).

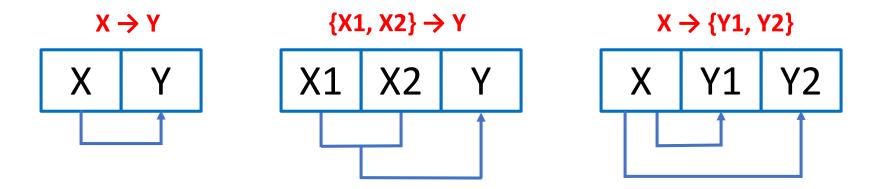

• It is referred as: Y is functionally dependent on the X or X functionally

determines Y.

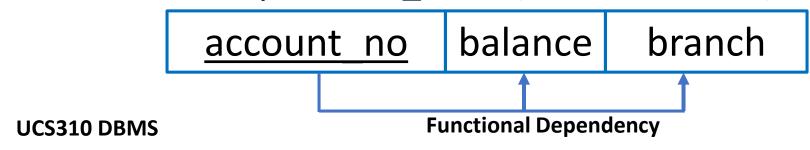

Stadent			
RollNo	Name	SPI	BL
101	Raju	8	0
102	Mitesh	7	1
103	Jay	7	0

Diagrammatic representation of (FD)

- Example
- Consider the relation Account(account_no, balance, branch).
- account_no can determine balance and branch.
- So, there is a functional dependency from account_no to balance and branch.
- This can be denoted by account_no \rightarrow {balance, branch}.

- Full Functional Dependency
 - In a relation, the attribute B is fully functional dependent on A if B is functionally dependent on A, but not on any proper subset of A.
 - Eg. {Roll_No, Semester, Department_Name} → SPI
 - We need all three {Roll_No, Semester, Department_Name} to find SPI.

- Partial Functional Dependency
 - In a relation, the attribute B is partial functional dependent on A if B is functionally dependent on A as well as on any proper subset of A.
 - If there is some attribute that can be removed from A and the still dependency holds then it is partial functional dependancy.
 - Eg. {Enrollment_No, Department_Name} → SPI
 - Enrollment_No is sufficient to find SPI, Department_Name is not required to find SPI.

- Transitive Functional Dependency
 - In a relation, if attribute(s) A → B and B → C, then A → C (means C is transitively depends on A via B).

Sub_Fac		
Subject	Faculty	Age
DS	Shah	35
DBMS	Patel	32
DF	Shah	35

- Eg. Subject → Faculty & Faculty → Age then Subject → Age
- Therefore as per the rule of transitive dependency: Subject → Age should hold, that makes sense because if we know the subject name we can know the faculty's age.

- Trivial Functional Dependency
 - X → Y is trivial FD if Y is a subset of X
 - Eg. {Roll_No, Department_Name, Semester} → Roll_No

- Nontrivial Functional Dependency
 - X → Y is nontrivial FD if Y is not a subset of X
 - Eg. {Roll_No, Department_Name, Semester} → Student_Name

Armstrong's axioms OR Inference rules

• Armstrong's axioms are a set of rules used to infer (derive) all the functional dependencies on a relational database.

Reflexivity

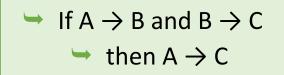

If B is a subset of Athen A → B

Augmentation

→ If A \rightarrow B → then AC \rightarrow BC

Selfdetermination → If A → A

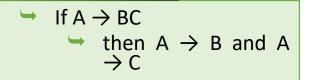

Transitivity

Pseudo

Transitivity

Decomposition

Union

Composition

Closure of a set of FDs

What is closure of a set of FDs?

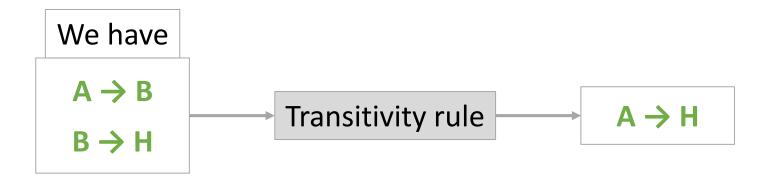

- Given a set F set of functional dependencies, there are certain other functional dependencies that are logically implied by F.
- E.g.: $F = \{A \rightarrow B \text{ and } B \rightarrow C\}$, then we can infer that $A \rightarrow C$ (by transitivity rule)
- The set of functional dependencies (FDs) that is logically implied by F is called the closure of F.
- It is denoted by F⁺.

Suppose we are given a relation schema R(A,B,C,G,H,I) and the set of functional dependencies are:

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H)

• The functional dependency $A \rightarrow H$ is logical implied.

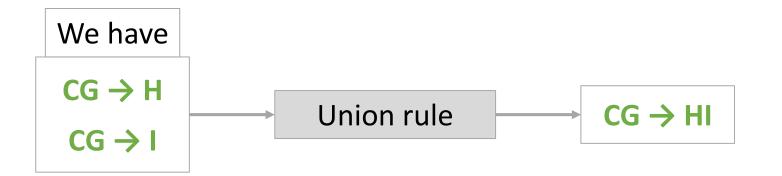

Suppose we are given a relation schema R(A,B,C,G,H,I) and the set of functional dependencies are:

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H)

The functional dependency CG → HI is logical implied.

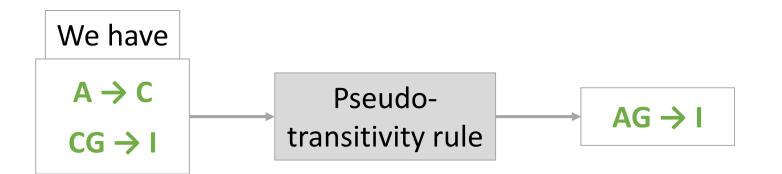

Suppose we are given a relation schema R(A,B,C,G,H,I) and the set of functional dependencies are:

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H)

• The functional dependency $AG \rightarrow I$ is logical implied.

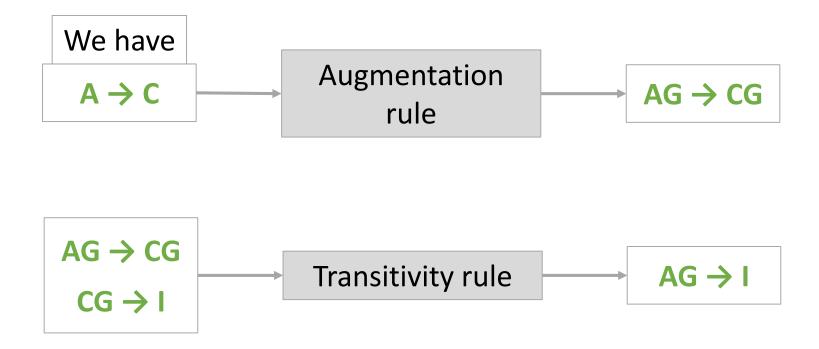

Suppose we are given a relation schema R(A,B,C,G,H,I) and the set of functional dependencies are:

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H)

The functional dependency AG → I is logical implied.

Suppose we are given a relation schema R(A,B,C,G,H,I) and the set of functional dependencies are:

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H)

Find out the closure of F.

Several members of F⁺ are

$$F^+ = (A \rightarrow H, CG \rightarrow HI, AG \rightarrow I)$$

Compute the closure of the following set F of functional dependencies FDs for relational schema R = (A,B,C,D,E,F):

$$\rightarrow$$
 F = (A \rightarrow B, A \rightarrow C, CD \rightarrow E, CD \rightarrow F, B \rightarrow E)

Find out the closure of F.

$A \rightarrow B \& A \rightarrow C$	Union Rule	$A \rightarrow BC$
$CD \rightarrow E \& CD \rightarrow F$	Union Rule	CD → EF
$A \rightarrow B \& B \rightarrow E$	Transitivity Rule	$A \rightarrow E$
$A \rightarrow C \& CD \rightarrow E$	Pseudo-transitivity Rule	$AD \rightarrow E$
$A \rightarrow C \& CD \rightarrow F$	Pseudo-transitivity Rule	$AD \rightarrow F$

$$F^+ = (A \rightarrow BC, CD \rightarrow EF, A \rightarrow E, AD \rightarrow E, AD \rightarrow F)$$

Compute the closure of the following set F of functional dependencies FDs for relational schema R = (A,B,C,D,E):

$$\rightarrow$$
 F = (AB \rightarrow C, D \rightarrow AC, D \rightarrow E)

Find out the closure of F.

$D \rightarrow AC$	Decomposition Rule	$D \rightarrow A \& D \rightarrow$
$D \rightarrow AC \& D \rightarrow E$	Union Rule	D → ACE

$$F^+ = (D \rightarrow A, D \rightarrow C, D \rightarrow ACE)$$

What is an anomaly in database design?

- Anomalies are problems that can occur in poorly planned, un-normalized database where all the data are stored in one table.
- There are three types of anomalies that can arise in the database because of redundancy are
 - Insert anomaly
 - Delete anomaly
 - Update / Modification anomaly

Insert anomaly

Consider a relation Emp_Dept(EID, Ename, City, DID, Dname, Manager) ElD as a primary key

Emp_Dept

EID	Ename	City	DID	Dname	Manager
1	Raj	Rajkot	1	CE	Shah
2	Meet	Surat	1	CE	Shah
N/L	NULL	NULL	2	IT	NULL

An insert anomaly occurs when certain attributes cannot be inserted into the database without the presence of another attribute.

Want to insert new department detail

- Suppose a new department (IT) has been started by the organization but initially there is no employee appointed for that department.
- We want to insert that department detail in Emp_Dept table.
- But the tuple for this department cannot be inserted into this table as the EID will have NULL value, which is not allowed because EID is primary key.
- This kind of problem in the relation where some tuple cannot be inserted is known as insert anomaly.

Delete anomaly

Consider a relation Emp_Dept(<u>EID</u>, Ename, City, DID, Dname, Manager) EtD as a relation Emp_Dept(<u>EID</u>, Ename, City, DID, Dname, Manager)

Emp_	_Dept				
<u>EID</u>	Ename	City	DID	Dname	Manager
1	Raj	Rajkot	1	CE	Shah
2	Meet	Surat	1	CE	Shah
3	Jay	Baroda	2	IT	Dave

A delete anomaly exists when certain attributes are lost because of the deletion of another attribute.

Want to delete (Jay) employee's detail

- Now consider there is only one employee in some department (IT) and that employee leaves the organization.
- So we need to delete tuple of that employee (Jay).
- But in addition to that information about the department also deleted.
- This kind of problem in the relation where deletion of some tuples can lead to loss of some other data not intended to be removed is known as delete anomaly.

Update anomaly

Consider a relation Emp_Dept(EID, Ename, City, Dname, Manager) EID as a primary

Emp_	_Dept			
EID	Ename	City	Dname	Manager
1	Raj	Rajkot	CE	Sah
2	Meet	Surat	C.E	Shah
3	Jay	Baroda	Computer	Shaah
4	Hari	Rajkot	IT	Dave

An update anomaly exists when one or more records (instance) of duplicated data is updated, but not all.

Want to update manager of CE department

- Suppose the manager of a (CE) department has changed, this requires that the Manager in all the tuples corresponding to that department must be changed to reflect the new status.
- If we fail to update all the tuples of given department, then two different records of employee working in the same department might show different Manager lead to inconsistency in the database.

How to deal with insert, delete and update anemaly

Emp_C	Pept				
EID	Ename	City	DID	Dname	Manager
1	Raj	Rajkot	1	CE	Shah
2	Meet	Surat	1	C.E	Shah
3	Jay	Baroda	2	IT	Dave
NU .	NULL	NULL	3	EC	NULL

Emp					
<u>EID</u>	Ename	City	DID		
1	Raj	Rajkot	1		
2	Meet	Surat	1		
3	Jay	Baroda	2		

Dept Deemed to be University)				
DID	Dname	Manager		
1	CE	Shah		
2	IT	Dave		
3	EC	NULL		

Such type of anomalies in the database design can be solved by using **normalization**.

Closure of attribute sets

What is a closure of attribute sets?

- Given a set of attributes α , the closure of α under F is the set of attributes that are functionally determined by α under F.
- It is denoted by α^+ .

What is a closure of attribute sets?

- Given a set of attributes α , the closure of α under F is the set of attributes that are functionally determined by α under F.
- It is denoted by α^+ .

Algorithm \rightarrow Algorithm to compute α^+ , the closure of α under F → Steps 1. result = α 2. while (changes to result) do \rightarrow for each $\beta \rightarrow \gamma$ in F do begin if $\beta \subseteq \text{result then result} = \text{result} \cup \gamma$ else result = result end

Closure of attribute sets [Example]

- Consider the relation schema R = (A, B, C, G, H, I).
- For this relation, a set of functional dependencies F can be given as

$$F = \{A \rightarrow B, A \rightarrow C, CG \rightarrow H, CG \rightarrow I, B \rightarrow H\}$$

• Find out the closure of (AG)+.

- \rightarrow Algorithm to compute α^+ , the closure of α under F
 - → Steps
 - 1. result = α
 - 2. while (changes to result) do
 - \rightarrow for each $\beta \rightarrow \gamma$ in F do
 - begin
 - if β ⊆ result then result = result U
 - else result = result
 - end

Step 1.		
result = α	=>	result = AG

$A \rightarrow B$	A⊆AG	result = ABG
$A \rightarrow C$	A ⊆ ABG	result = ABCG
CG → H	CG ⊆ ABCG	result = ABCGH
CG → I	CG ⊆ ABCGH	result = ABCGHI
$B \rightarrow H$	B ⊆ ABCGHI	result = ABCGHI

$$AG^+ = ABCGHI$$

Closure of attribute sets [Exercise]

- Given functional dependencies (FDs) for relational schema R = (A,B,C,D,E):
- $F = \{A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A\}$
 - Find Closure for A
 - Find Closure for CD
 - Find Closure for B
 - Find Closure for BC
 - Figure 1 re for E

$$A^+ = ABCDE$$

$$CD^+ = ABCDE$$

$$B^+ = BD$$

$$BC^+ = ABCDE$$

$$E^+ = ABCDE$$

x	Y	z
1	1	1
2	1	2
2	1	3
3	1	1

Which of the following is Functional Dependency?

- X→Y
- 2. XY→Z
- 3. YZ→X

```
R(A,B,C,D,E,G)
{
A→B
B→C
D→E
E→G
}
```

The following functional dependencies are given:

$$AB \rightarrow CD, AF \rightarrow D, DE \rightarrow F, C \rightarrow G, F \rightarrow E, G \rightarrow A.$$

Which one of the following options is false?

(A)
$$\{CF\}^+ = \{ACDEFG\}$$
 (C) $\{AF\}^+ = \{ACDEFG\}$

(B)
$$\{BG\}^+ = \{ABCDG\}$$
 (D) $\{AB\}^+ = \{ABCDFG\}$

Canonical cover

What is extraneous attributes?

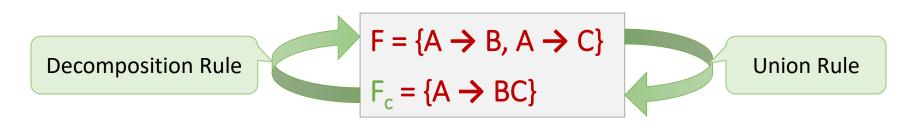

- Let us consider a relation R with schema R = (A, B, C) and set of functional dependencies FDs F = { AB → C, A → C }.
- In AB → C, B is extraneous attribute. The reason is, there is another FD A → C, which means when A alone can determine C, the use of B is unnecessary (extra).
- An attribute of a functional dependency is said to be extraneous if we can remove it without changing the closure of the set of functional dependencies.

What is canonical cover?

- A canonical cover of F is a minimal set of functional dependencies equivalent to F, having no redundant dependencies or redundant parts of dependencies.
- It is denoted by F_c
- A canonical cover for F is a set of dependencies F_c such that
 - F logically implies all dependencies in F_c and
 - F_c logically implies all dependencies in F and
 - No functional dependency in F_c contains an extraneous attribute and
 - Each left side of functional dependency in F_c is unique.

Algorithm to find canonical cover

- Repeat
 - Use the union rule to replace any dependencies in F $\alpha 1 \rightarrow \beta 1$ and $\alpha 1 \rightarrow \beta 2$ with $\alpha 1 \rightarrow \beta 1\beta 2$
 - Find a functional dependency $\alpha \rightarrow \beta$ with an extraneous attribute either in α or in β

```
/* Note: test for extraneous attributes done using F_c, not F */
```

- If an extraneous attribute is found, delete it from $\alpha \rightarrow \beta$
- until F does not change

```
/* Note: Union rule may become applicable after some extraneous attributes have been deleted, so it has to be re-applied */
```

Canonical cover [Example]

(Deemed to be University)

Consider the relation schema R = (A, B, C) with FDs

$$F = \{A \rightarrow BC, B \rightarrow C, A \rightarrow B, AB \rightarrow C\}$$

- Find canonical cover.
- Combine A \rightarrow BC and A \rightarrow B into A \rightarrow BC (Union Rule)
 - Set is $\{A \rightarrow BC, B \rightarrow C, AB \rightarrow C\}$
- A is extraneous in AB \rightarrow C
 - Check if the result of deleting A from AB \rightarrow C is implied by the other dependencies
 - Yes: in fact, B → C is already present
 - Set is $\{A \rightarrow BC, B \rightarrow C\}$
- C is extraneous in A \rightarrow BC
 - Check if A \rightarrow C is logically implied by A \rightarrow B and the other dependencies
 - Yes: using transitivity on $A \rightarrow B$ and $B \rightarrow C$.
 - The canonical cover is: $A \rightarrow B$, $B \rightarrow C$

Canonical cover [Example]

(Deemed to be University)

Consider the relation schema R = (A, B, C, D, E, F) with FDs

$$F = \{A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A\}$$

Find canonical cover.

- The left side of each FD in F is unique.
- Also none of the attributes in the left side or right side of any of the FDs is extraneous.
- Therefore the canonical cover F_c is equal to F.
- $F_c = \{A \rightarrow BC, CD \rightarrow E, B \rightarrow D, E \rightarrow A\}$

Decomposition

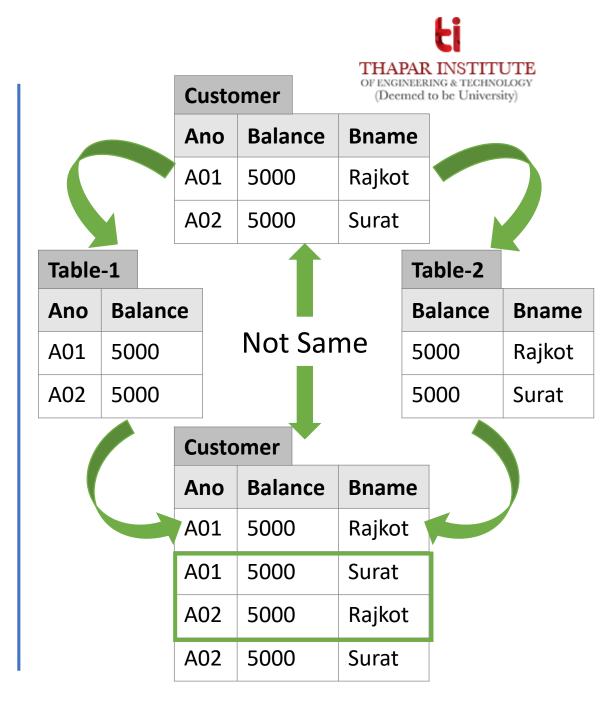

What is decomposition?

- Decomposition is the process of breaking down given relation into two or more relations.
- Relation R is replaced by two or more relations in such a way that:
 - Each new relation contains a subset of the attributes of R
 - Together, they all include all tuples and attributes of R
- Types of decomposition
 - Lossy decomposition
 - Lossless decomposition (non-loss decomposition)

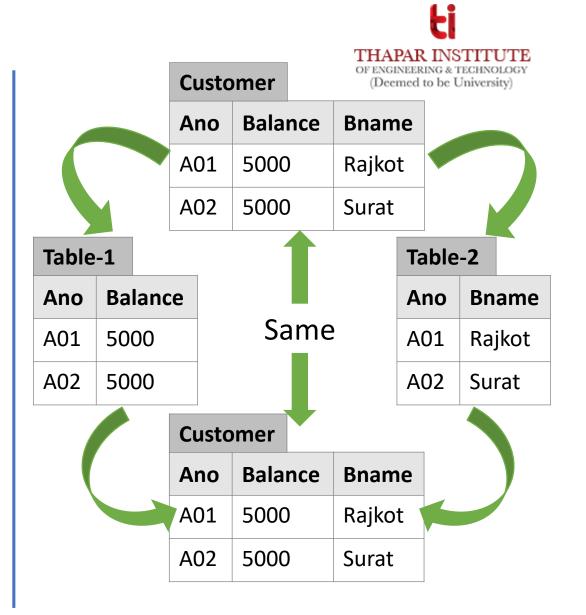

Lossy decomposition

- The decomposition of relation R into R1 and R2 is lossy when the join of R1 and R2 does not yield the same relation as in R.
- This is also referred as lossy-join decomposition.
- The disadvantage of such kind of decomposition is that some information is lost during retrieval of original relation.
- From practical point of view, decomposition should not be lossy decomposition.

Lossless decomposition

- The decomposition of relation R into R1 and R2 is lossless when the join of R1 and R2 produces the same relation as in R.
- This is also referred as a non-additive (non-loss) decomposition.
- All decompositions must be lossless.

Normalization and normal forms

What is normalization?

- Normalization is the process of removing redundant data from tables to improve data integrity, scalability and storage efficiency.
 - data integrity (completeness, accuracy and consistency of data)
 - scalability (ability of a system to continue to function well in a growing amount of work)
 - storage efficiency (ability to store and manage data that consumes the least amount of space)
- What we do in normalization?
 - Normalization generally involves splitting an existing table into multiple (more than one) tables, which can be re-joined or linked each time a query is issued (executed).

How many normal forms are there?

- Normal forms:
 - 1NF (First normal form)
 - 2NF (Second normal form)
 - 3NF (Third normal form)
 - BCNF (Boyce–Codd normal form)
 - 4NF (Forth normal form)
 - 5NF (Fifth normal form)

As we move from 1NF to 5NF number of tables and complexity increases but redundancy decreases.

Normal forms 1NF (First Normal Form)

1NF (First Normal Form)

Conditions for 1NF

Each cells of a table should contain a single value.

• A relation R is in first normal form (1NF) if and only if it does not contain any composite attribute or multi-valued attributes or their combinations.

OR

• A relation R is in first normal form (1NF) if and only if all underlying domains contain atomic values only.

1NF (First Normal Form) [Example - Composite attribute]

Custo	omer	
CID	Name	Address
C01	Raju	Jamnagar Road, Rajkot
C02	Mitesh	Nehru Road, Jamnagar
C03	Jay	C.G Road, Ahmedabad

• In customer relation address is composite attribute which is further divided into sub-attributes as "Road" and "City".

(Deemed to be University)

- So customer relation is not in 1NF.
- Problem: It is difficult to retrieve the list of customers living in 'Jamnagar' city from customer table.
- The reason is that address attribute is composite attribute which contains road name as well as city name in single cell.
- It is possible that city name word is also there in road name.
- In our example, 'Jamnagar' word occurs in both records, in first record it is a part of road name and in second one it is the name of city.

1NF (First Normal Form) [Example - Composite attribute]

(Deemed to be University)

Custo	omer	
CID	Name	Address
C01	Raju	Jamnagar Road, Rajkot
C02	Mitesh	Nehru Road, Jamnagar
C03	Jay	C.G Road, Ahmedabad

Customer				
CID	Name	Road	City	
C01	Raju	Jamnagar Road	Rajkot	
C02	Mitesh	Nehru Road	Jamnagar	
C03	Jay	C.G Road	Ahmedabad	

• Solution: Divide composite attributes into number of sub-attributes and insert

value in proper sub-attribute.

Exercise Convert below relation into 1NF (First Normal

Form)

Person

PID	Full_Name	City
P01	Raju Maheshbhai Patel	Rajkot

1NF (First Normal Form) [Example - Multivalued attelbute]

THAPAR INSTITUTE
OF ENGINEERING & TECHNOLOGY
(Deemed to be University)

Stude	ent	
Rno	Name	FailedinSubjects
101	Raju	DS, DBMs
102	Mitesh	DBMS, DS
103	Jay	DS, DBMS, DE
104	Jeet	DBMS, DE, DS
105	Harsh	DE, DBMS, DS
106	Neel	DE, DBMS

- In student relation FailedinSubjects attribute is a multivalued attribute which can store more than one values.
- So above relation is not in 1NF.

- Problem: It is difficult to retrieve the list of students failed in 'DBMS' as well as 'DS' but not in other subjects from student table.
- The reason is that FailedinSubjects attribute is multi-valued attribute so it contains more than one value.

1NF (First Normal Form) [Example - Multivalued attelbute]

THAPAR INSTITUTI	Е
OF ENGINEERING & TECHNOLOGY	Y
(Deemed to be University)	

Stude	ent	
Rno	Name	FailedinSubjects
101	Raju	DS, DBMs
102	Mitesh	DBMS, DS
103	Jay	DS, DBMS, DE
104	Jeet	DBMS, DE, DS
105	Harsh	DE, DBMS, DS
106	Neel	DE, DBMS

Resu	lt	
RID	Rno	Subject
1	101	DS
2	101	DBMS
3	102	DBMS
4	102	DS
5	103	DS
•••	•••	•••

- Solution: Split the table into two tables in such as way that
 - the first table contains all attributes except multi-valued attribute with same primary key and
 - second table contains multi-valued attribute and place a primary key in it.
 - insert the primary key of first table in the second table as a foreign key.

Normal forms 2NF (Second Normal Form)

2NF (Second Normal Form)

Conditions for 2NF

It is in 1NF and each table should contain a single primary key.

- A relation R is in second normal form (2NF)
 - if and only if it is in 1NF and
 - every non-primary key attribute is fully dependent on the primary key

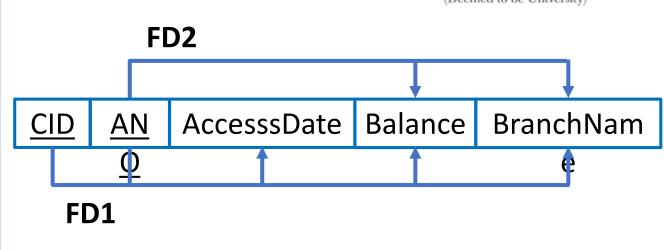

OR

- A relation R is in second normal form (2NF)
 - if and only if it is in 1NF and
 - no any non-primary key attribute is partially dependent on the primary key

2NF (Second Normal Form) [Example]

Custo	omer			
CID	ANO	AccessDate	Balance	BranchName
C01	A01	01-01-2017	50000	Rajkot
C02	A01	01-03-2017	50000	Rajkot
C01	A02	01-05-2017	25000	Surat
C03	A02	01-07-2017	25000	Surat

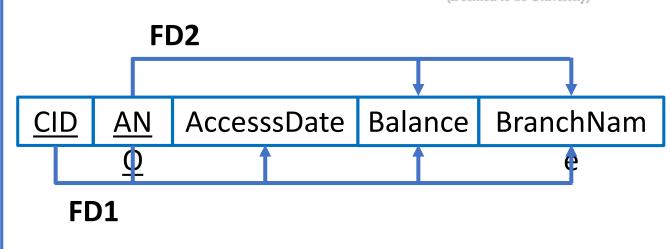

- **FD1**: {CID, ANO} → {AccesssDate, Balance, BranchName}
- **FD2**: ANO → {Balance, BranchName}
- Balance and BranchName are partial dependent on primary key (CID + ANO). So customer relation is not in 2NF.

2NF (Second Normal Form) [Example]

Customer					
CID	ANO	AccessDate	Balance	BranchName	
C01	A01	01-01-2017	50000	Rajkot	
C02	A01	01-03-2017	50000	Rajkot	
C01	A02	01-05-2017	25000	Surat	
C03	A02	01-07-2017	25000	Surat	

- Problem: For example, in case of a joint account multiple (more than one) customers have common (one) accounts.
- If an account 'A01' is operated jointly by two customers says 'C01' and 'C02' then data values for attributes Balance and BranchName will be duplicated in two different tuples of customers 'C01' and 'C02'.

2NF (Second Normal Form) [Example]

Custo	omer					
CID	<u>ANO</u>	AccessDate	Balance	BranchName	4	
C01	A01	01-01-2017	50000	Rajkot		
C02	A01	01-03-2017	50000	Rajkot	4	
C01	A02	01-05-2017	25000	Surat	>	
C03	A02	01-07-2017	25000	Surat		

Table-1		
ANO	Balance	BranchName
A01	50000	Rajkot
A02	25000	Surat

e-2	
ANO	AccessDate
A01	01-01-2017
A01	01-03-2017
A02	01-05-2017
A02	01-07-2017
	ANO A01 A01 A02

- Solution: Decompose relation in such a way that resultant relations do not have any partial FD.
 - Remove partial dependent attributes from the relation that violets 2NF.
 - Place them in separate relation along with the prime attribute on which they are fully dependent.
 - The primary key of new relation will be the attribute on which it is fully dependent.
 - Keep other attributes same as in that table with the same primary key.

Normal forms 3NF (Third Normal Form)

3NF (Third Normal Form)

Conditions for 3NF

It is in 2NF and there is no transitive dependency.

(Transitive dependency???) $A \rightarrow B \& B \rightarrow C$ then $A \rightarrow C$

- A relation R is in third normal form (3NF)
 - if and only if it is in 2NF and
 - every non-key attribute is non-transitively dependent on the primary key

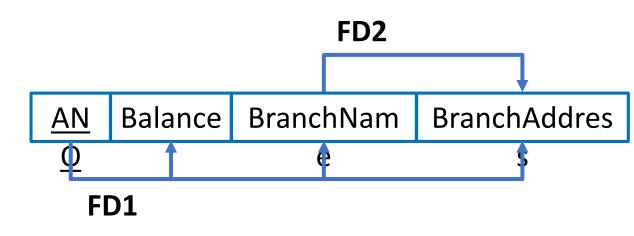

OR

- A relation R is in third normal form (3NF)
 - if and only if it is in 2NF and
 - no any non-key attribute is transitively dependent on the primary key

3NF (Third Normal Form) [Example]

Customer				
<u>ANO</u>	Bala	nce	BranchName	BranchAddress
A01	5000	00	Rajkot	Kalawad road
A02	4000	00	Rajkot	Kalawad Road
A03	3500	00	Surat	C.G Road
A04	2500	00	Surat	C.G Road

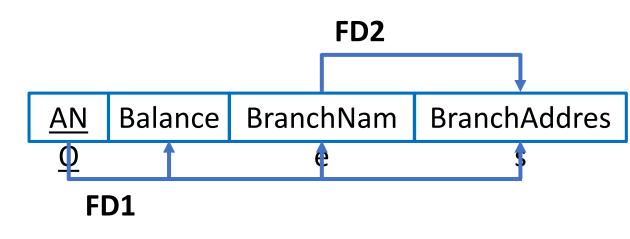

- **FD1**: ANO → {Balance, BranchName, BranchAddress}
- **FD2**: BranchName → BranchAddress
- So AccountNO → BranchAddress (Using Transitivity rule)
- BranchAddress is transitive depend on primary key (ANO). So customer relation is not in 3NF.

3NF (Third Normal Form) [Example]

Customer				
<u>ANO</u>	Balan	ce Bra	nchName	BranchAddress
A01	50000) Rajl	ot	Kalawad road
A02	40000) Rajl	ot	Kalawad Road
A03	35000	Sura	at	C.G Road
A04	25000	Sura	at	C.G Road

• **Problem:** In this relation, **branch address will be stored repeatedly** for each account of the same branch which **occupies more space**.

3NF (Third Normal Form) [Example]

Table 2

Customer				
<u>ANO</u>	Bala	nce	BranchName	BranchAddress
A01	5000	00	Rajkot	Kalawad road
A02	4000	00	Rajkot	Kalawad Road
A03	3500	00	Surat	C.G Road
A04	2500	00	Surat	C.G Road

Table-1	
BranchName	BranchAddress
Rajkot	Kalawad road
Surat	C.G Road

iable.		
ANO	Balance	BranchName
A01	50000	Rajkot
A02	40000	Rajkot
A03	35000	Surat
A04	25000	Surat

- Solution: Decompose relation in such a way that resultant relations do not have any transitive FD.
 - Remove transitive dependent attributes from the relation that violets 3NF.
 - Place them in a new relation along with the non-prime attributes due to which transitive dependency occurred.
 - The primary key of the new relation will be non-prime attributes due to which transitive dependency occurred.
 - Keep other attributes same as in the table with same primary key and add prime attributes of other relation into it as a foreign key.

Normal forms BCNF (Boyce-Codd Normal Form)

BCNF (Boyce-Codd Normal Form)

- Conditions for BCNF
 - BCNF is based on the concept of a determinant.

It is in 3NF and every determinant should be primary key.

Primary (Deemed to be Dependent Kev $AccountNO \rightarrow \{Balance,$ Branch}

- A relation R is in Boyce-Codd normal form (BCNF)
 - if and only if it is in 3NF and
 - for every functional dependency $X \rightarrow Y$, X should be the primary key of the table.

OR

- A relation R is in Boyce-Codd normal form (BCNF)
 - if and only if it is in 3NF and
 - every prime key attribute is non-transitively dependent on the primary key

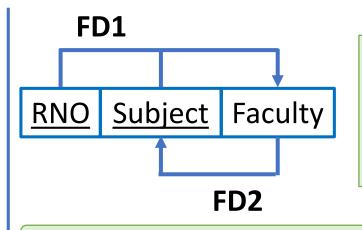

OR

- A relation R is in Boyce-Codd normal form (BCNF)
 - if and only if it is in 3NF and
 - no any prime key attribute is transitively dependent on the primary key

BCNF (Boyce-Codd Normal Form) [Example]

Student			
RNO	<u>Subject</u>	Faculty	
101	DS	Patel	
102	DBMS	Shah	
103	DS	Jadeja	
104	DBMS	Dave	
105	DBMS	Shah	
102	DS	Patel	
101	DBMS	Dave	
105	DS	Jadeja	

- FD1: RNO, Subject → Faculty
- **FD2**: Faculty → Subject
- So {RNO, Subject} → Subject (Transitivity rule)

In FD2, determinant is Faculty which is not a primary key. So student table is not in BCNF.

Problem: In this relation one student can learn more than one subject with different faculty then records will be stored repeatedly for each student, language and faculty combination which occupies more space.

- Here, one faculty teaches only one subject, but a subject may be taught by more than one faculty.
- A student can learn a subject from only one faculty.

BCNF (Boyce-Codd Normal Form) [Example]

THAPAR INSTITUTE

(Deemed to be University)

Student

RNO	<u>Subject</u>	Faculty
101	DS	Patel
102	DBMS	Shah
103	DS	Jadeja
104	DBMS	Dave
105	DBMS	Shah
102	DS	Patel
101	DBMS	Dave
105	DS	Jadeja

Table-1

<u>Faculty</u>	Subject
Patel	DS
Shah	DBMS
Jadeja	DS
Dave	DBMS

Table-2

RNO	<u>Faculty</u>
101	Patel
102	Shah
103	Jadeja
104	Dave
105	Shah
102	Patel
101	Dave
105	Jadeja

- Solution: Decompose relation in such a way that resultant relations do not have any transitive FD.
 - Remove transitive dependent prime attribute from relation that violets BCNF.
 - Place them in separate new relation along with the non-prime attribute due to which transitive dependency occurred.
 - The primary key of new relation will be this non-prime attribute due to which transitive dependency occurred.
 - Keep other attributes same as in that table with same primary key and add a prime attribute of other relation into it as a foreign key.

Multivalued dependency (MVD)

THAPAR INSTITUTE
OF ENGINEERING & TECHNOLOGY

• For a dependency $X \rightarrow Y$, if for a single value of X, multiple values of Y exists, then the table may have multi-valued dependency.

Student			
RNO	<u>Subject</u>	<u>Faculty</u>	
101	DS	Patel	
101	DBMS	Patel	
101	DS	Shah	
101	DBMS	Shah	

- Multivalued dependency (MVD) is denoted by $\rightarrow \rightarrow$
- Multivalued dependency (MVD) is represented as X →→ Y

Normal forms 4NF (Forth Normal Form)

4NF (Forth Normal Form)

- Conditions for 4NF
- A relation R is in fourth normal form (4NF)
 - if and only if it is in **BCNF** and
 - has no multivalued dependencies

Student			
RNO	<u>Subject</u>	<u>Faculty</u>	
101	DS	Patel	
101	DBMS	Patel	
101	DS	Shah	
101	DBMS	Shah	

Subject		
RNO Subject		
101	DS	
101	DBMS	

Faculty		
RNO Faculty		
101	Patel	
101	Shah	

 Above student table has multivalued dependency. So student table is not in 4NF.

Functional dependency & Multivalued dependency

• A table can have both functional dependency as well as multi-valued dependency together.

- RNO → Address
- RNO $\rightarrow \rightarrow$ Subject

Stude	nt	→ Faculty		
RNO	Address		<u>Subject</u>	<u>Faculty</u>
101	C. G.	Road, Rajkot	DS	Patel
101	C. G.	Road, Rajkot	DBMS	Patel
101	C. G.	Road, Rajkot	DS	Shah
101	C. G.	Road, Rajkot	DBMS	Shah

Subject		
RNO	Sub	<u>iect</u>
101	DS	
101	DBM	15

Faculty		
RNO Faculty		
101	Patel	
101	Shah	

Address		
RNO	Address	
101	C. G.	Road, Rajkot

Normal forms 5NF (Fifth Normal Form)

5NF (Fifth Normal Form)

- Conditions for 5NF
- A relation R is in fifth normal form (5NF)
 - if and only if it is in 4NF and

• it cannot have a lossless decomposition in to any number of smaller tables (relations).

Student_Result

RID	RNO	Name	Subject	Result
1	101	Raj	DBMS	Pass
2	101	Raj	DS	Pass
3	101	Raj	DF	Pass
4	102	Meet	DBMS	Pass
5	102	Meet	DS	Fail
6	102	Meet	DF	Pass
7	103	Suresh	DBMS	Fail
8	103	Suresh	DS	Pass

Student_Result relation is **further decomposed** into sub-relations. So the above relation is **not in 5NF**.

5NF (Fifth Normal Form)

Result

- Conditions for 5NF
- A relation R is in fifth normal form (5NF)
 - if and only if it is in 4NF and

• it cannot have a lossless decomposition in to any number of smaller tables (relations). **Student Result** Student

Jeane Liesait				
RID	RNO	Name	Subject	Result
1	101	Raj	DBMS	Pass
2	101	Raj	DS	Pass
3	101	Raj	DF	Pass
4	102	Meet	DBMS	Pass
5	102	Meet	DS	Fail
6	102	Meet	DF	Pass
7	103	Suresh	DBMS	Fail
8	103	Suresh	DS	Pass

<u>RNO</u>	Name
101	Raj
102	Meet
103	Suresh

SID	Name
1	DBMS
2	DS
3	DF
	1

Subject

RID	RNO	SID	Result
1	101	1	Pass
2	101	2	Pass
3	101	3	Pass
4	102	1	Pass
5	102	2	Fail
6	102	3	Pass
7	103	1	Fail
8	103	2	Pass

None of the above relations can be further decomposed into sub-relations. So the above database is in 5NF.

- A software contract and consultancy firm maintains details of all the various projects in which its employees are currently involved. These details comprise: Employee Number, Employee Name, Date of Birth, Department Code, Department Name, Project Code, Project Description, Project Supervisor.
- Assume the following:
 - Each employee number is unique.
 - Each department has a single department code.
 - Each project has a single code and supervisor.
 - Each employee may work on one or more projects.
 - Employee names need not necessarily be unique.
 - Project Code, Project Description and Project Supervisor are repeating fields.
 - Normalize this data to Third Normal Form.

• A software contract and consultancy firm maintains details of all the various projects in which its employees are currently involved. These details comprise: Employee Number, Employee Name, Date of Birth, Department Code, Department Name, Project Code, Project Description, Project Supervisor.
